

Zenly — Device-Only Test Plan

Version	2.0 — rewritten 2026-07-27 for the current "Quiet" UI
Supersedes	the [Device] cases in TEST_CASES.md (v1 navigation is stale throughout)
Scope	Only what a physical iPhone can verify. Everything runnable on Simulator is already automated in ZenlyUITests/ZenlyQuietSuite + ZenlyTests and is not repeated here.
Total cases	53 across 8 sections

Every case below has been re-checked against the current source, so the navigation paths and on-screen wording match what you will actually see.

Why this rewrite exists

The Quiet redesign changed navigation and copy, and features were deleted. v1 sends you to screens that no longer exist. Concretely:

v1 said	Reality
"Profiles tab"	No such tab. Settings → Focus profiles , or Schedule → New profile
"Schedules" tab	Tab is named Schedule (singular)
"Start Focus" button	Button reads Begin focus
Splash: "Zenly / Find your focus", ~2.2s	"Zen-ly" / "A calm and simple way to stay focused." , auto-advances at 3.6s (1.6s Reduce Motion), tap to skip
Work / Study / Gym seeded	Four profiles — Work, Study, Gym, Sleep
"delete the app to re-test onboarding"	Does not work — see Prerequisites

Prerequisites

- iPhone running iOS 17+ (iPhone 14 Pro or later for Dynamic Island cases), unlocked, **Trust This Computer** accepted. Verify it appears in Xcode → Window → Devices and Simulators.
- Paid Apple Developer account. Family Controls Distribution is **already granted** for team 649T62WKAQ — no request needed.
- Build and run the Zenly scheme in **Debug** to the device.

Resetting to a true first-run state. Deleting the app is *not* enough: hasCompletedOnboarding and the seeded profiles live in the shared App Group container, which survives app deletion on Simulator and can survive it on device. To force a genuine first run, delete the app **and** reboot the phone before reinstalling; if onboarding still doesn't appear, the group state persisted — note it and move on rather than chasing it.

Recording results. Fill in the Result column. Anything not PASS needs a screenshot or screen recording attached.

A. Screen Time authorization

ID	v1	Case	Steps	Expected	Result
D-A1	1.3	Grant from onboarding	Fresh install → onboarding page 4 "Screen Time Access" → Grant Screen Time Access	System prompt appears; approving changes the button to Access Granted and advances to "You're all set"	
D-A2	1.3	Skip and grant later	On the same page tap Maybe later → finish onboarding → Focus tab	Home shows the "Screen Time access needed" card with a Grant Access button; Begin focus is disabled and dimmed until granted	
D-A3	—	Grant from Settings	Settings → Screen Time → Grant Screen Time Access	Prompt appears; after approving the row reads Access granted with a seal icon	
D-A4	—	Grant from Schedule	Schedule tab (unauthorized) → Grant access under "Schedules need Screen Time access to start on their own."	Prompt appears; notice disappears once granted	
D-A5	1.5 ⚠️	No repeated prompt	Grant once, then force-quit and reopen the app 5+ times; background/foreground it several times	The Screen Time prompt never reappears; Home never re-shows the access card	

D-A5 is a flagged regression case. Do it early — it is nearly free once the app is installed.

B. Blocking — the core of the product

None of this has ever been executed. It is the single biggest risk to launch. Set up a profile first: Settings → Focus profiles → pick one → configure under **Blocking**.

ID	v1	Case	Steps	Expected	Result
D-B1	2.1	Block specific apps	Profile → Blocking → Block all apps OFF → Blocked apps & sites → pick one app → Save → Begin focus → open that app	Zenly's custom shield appears instead of the app	
D-B2	2.2	Block all apps	Profile → Blocking → Block all apps ON (default) → Begin focus → try several apps and Safari	All non-system apps shielded. Phone, Messages, Settings and Zenly stay usable	
D-B3	2.3	Allowed apps escape hatch	Block-all ON → Allowed apps → add one app → Save → Begin focus → open it	It opens normally; everything else stays blocked	
D-B4	2.4	Research mode allowlist	Profile → Research mode — allowed websites = <code>claude.ai</code> , <code>docs.google.com</code> → Save → Begin focus → Safari → visit an allowed site, then an entertainment site	Allowed sites load; every other site is blocked. Safari itself still opens	
D-B5	2.5	Custom shield message	Settings → Shield message = "Future you will thank you" → Begin focus → open a blocked app	Shield shows the custom message. Clearing the field restores the default text	
D-B6	2.6	Strict-mode gate	Profile → Session → Strict ON → Begin focus → End early	Confirmation appears with a streak-loss warning; primary button counts down " Wait 5s... " and is disabled until it becomes End focus . Keep focusing cancels	
D-B7	2.7	Unblock on end	End the session (normally or early) → reopen the previously blocked apps and sites	Everything opens normally again; no lingering shield	
D-B8	—	Non-strict end	Strict OFF → Begin focus → End early	Session ends immediately with no confirmation gate	
D-B9	—	Shield survives relaunch	During a session, force-quit Zenly → open a blocked app	Still shielded (enforcement lives in ManagedSettings, not the app process)	

C. Sessions & timer

ID	v1	Case	Steps	Expected	Result
D-C1	3.1	Start a session	Focus tab → set duration with -/+ → Begin focus	Full-screen session with countdown ring; blocking engages; start haptic fires	
D-C2	3.3	Minimize & resume	In session tap ▼ (top-left) → browse other tabs → return via the resume banner	Session keeps running; app is navigable; banner reopens the timer. Begin focus stays disabled while active	
D-C3	3.4	Natural completion	Start a 5-minute session and wait it out	Celebration summary with confetti + haptic; " Focus complete " notification; shields lift	
D-C4	3.5 ⚠️	Recorded after app is killed	Start a session, leave Zenly until iOS terminates it, reopen after the end time	Session is recorded — streak / today's minutes update. Reported PASS on 2026-07-27 — re-confirm on the current build	
D-C5	3.5b	Resume mid-session after kill	Start a long session, force-quit, reopen before the end time	Timer resumes with the correct remaining time (not restarted, not lost)	
D-C6	3.6	End early excluded	Start a session, end early	Logged as ended early; does not add to streak or today's minutes	
D-C7	3.7	Pomodoro break	Profile with a non-zero Break → complete a focus session → Take a break	Break timer runs with no blocking ; " Break over " notification at the end	
D-C8	3.8	Post-session review	On the summary, tap a star rating and type a note → Done	Saves against that session (now verifiable via Insights → See all sessions → tap the session, see D-I5)	

D. Live Activity, Dynamic Island & Widget

D-D4 is a regression test for a bug fixed on 2026-07-27 — please do it carefully.

ID	v1	Case	Steps	Expected	Result
D-D1	7.2	Lock Screen activity	Begin focus → lock the phone	Lock Screen banner with profile name and a live countdown, tinted to the profile accent	
D-D2	7.3	Dynamic Island	Begin focus (iPhone 14 Pro+)	Compact pill counts down; long-press expands to profile + progress	
D-D3	—	Activity appears at all	Begin focus	The Live Activity appears — this is the regression risk from the fix; if it never shows, the sweep in <code>end()</code> is tearing down the new activity	
D-D4	NEW	Activity clears after termination (Finding 6)	Begin focus → leave Zenly until iOS terminates it → reopen → let the session end (or End early)	Dynamic Island and Lock Screen timer disappear . Previously the countdown was stranded on screen forever	
D-D5	NEW	No duplicate activities	Begin focus → force-quit → reopen mid-session	Exactly one Live Activity, not two side by side	
D-D6	—	Normal end clears it	Begin focus → End early without any termination	Activity disappears immediately	
D-D7	5.x	Schedule countdown activity	With an upcoming enabled schedule, open the app shortly before its start time	A "starting soon" countdown Live Activity appears and is replaced (not duplicated) by the session activity when the window opens	
D-D8	7.1	Home-screen widget	Add the Zenly widget → configure metric (streak / minutes / attempts)	Shows the chosen stat and updates after a session completes	

E. Schedules

ID	v1	Case	Steps	Expected	Result
D-E1	5.2	Auto-start in window	Schedule → Add schedule with a window covering now on today's weekday → Save → keep the app open	A focus session auto-starts within ~30s and blocking engages without tapping Begin focus	
D-E2	5.3	Weekday filtering	Create a schedule excluding today's weekday	Nothing starts and nothing is blocked today	
D-E3	—	Duration equals remaining window	Create a schedule ending in ~20 minutes → let it auto-start	Session length ≈ remaining minutes of the window, and may exceed the 120-minute manual cap (see report Finding 4 — confirm this is intended)	
D-E4	—	Toggle off disables	Toggle a schedule off before its window	No auto-start, no blocking	
D-E5	—	Start notification	Background the app before a schedule window opens	A time-sensitive schedule-start notification arrives and opening it starts the session	
D-E6	—	No hijack mid-session	Start a manual session, then let a schedule window open	The running session is not interrupted or replaced	

Heads-up: a saved schedule whose window covers "now" hijacks the UI into a full-screen session almost immediately. Create schedules for a *future* window unless you are testing D-E1.

F. System integration

ID	v1	Case	Steps	Expected	Result
D-F1	10.1	Siri / Shortcuts	"Hey Siri, start a focus session in Zenly", and run the action from the Shortcuts app	Zenly opens and starts a session with the active profile	
D-F2	10.2	Control Center	Add the Start Focus control (iOS 18+) → tap it	Zenly opens and starts a session	
D-F3	9.5	Focus filter	iOS Settings → Focus → add the Zenly filter → pick a profile → enable that Focus	Zenly switches to that profile on next open	
D-F4	—	Notification delivery in foreground	Keep Zenly open when a session completes	The completion notification is presented while foregrounded (regression fixed in 47c300f)	
D-F5	—	Time-sensitive breakthrough	Enable a Focus/Do Not Disturb mode, then let a schedule window open	The schedule-start notification breaks through	

G. Accessibility & appearance on device

ID	v1	Case	Steps	Expected	Result
D-G1	1.6	Reduce Motion	Settings → Accessibility → Reduce Motion ON → launch	Splash shows the static mark with no looping/breathing animation and advances after ~1.6s	
D-G2	11.1	VoiceOver on Home	VoiceOver ON → swipe through Focus tab	Duration announces "Focus duration, N minutes"; -/+ announce "Decrease/Increase focus duration"; profile chips announce their name and selected state	
D-G3	11.1	VoiceOver in session	VoiceOver ON during a session	Minimize and End early are labelled and operable; the countdown is readable	
D-G4	11.2	Dynamic Type XXXL	Set the largest accessibility text size → walk Focus, Insights, Schedule, Settings	No clipping or overlap. Settings → "Your name" was fixed on 2026-07-27 — label and field must sit on separate lines	
D-G5	—	Dark / Light	Toggle appearance	Both render correctly; no invisible text	
D-G6	—	Safe areas	Check Focus and the session screen on a Dynamic Island device	No content under the Island or the home indicator	

I. Insights — newly wired surfaces (added 2026-07-27)

Two of the orphaned surfaces were connected on request. Both need data, so they can only be checked on device after at least one session has completed.

ID	v1	Case	Steps	Expected	Result
D-I1	6.3	Distraction count shows	Complete a session during which you opened blocked apps a few times → Insights	Under the bar chart: " N distractions blocked this week ". $N > 0$ and roughly matches how many times you hit the shield (deduped ~1 per open)	
D-I2	6.3	Count increments	Note the number → run another session → trigger the shield 3 more times → return to Insights	The count rises by ~3	
D-I3	6.3	Zero state reads correctly	With no attempts this week	Shows " 0 distractions blocked this week " (plural), not blank or "1 distraction"	
D-I4	6.5	History reachable	Insights → scroll past the recent sessions → See all sessions	Pushes the History screen with a back button; shows day-grouped past sessions with duration, outcome, rating and note	
D-I5	6.5	History detail	In History, tap a session	Opens the session detail with its rating, note and the timestamped distraction attempts for that session's window	
D-I6	6.5	Empty history	Fresh install, no sessions	Insights shows its "Your focus story starts here" empty state; See all sessions is not reachable until a session exists (by design)	

Automated coverage already in place: the distraction *data* path is now unit-tested (`DistractionLogTests` , 6 tests) — recording, the 1.5s dedupe window, per-day bucketing, session-window attribution, and the fold into `weeklyStats()` that D-I1 displays. What remains for device is purely "is the right number on screen, and does History open".

H. Cannot be tested — no UI entry point

These were `[Device]` cases in v1. A phone will **not** help: the screens exist in the codebase but nothing navigates to them. `AnalyticsView` is a flat terminal screen — it contains a `NavigationStack` but zero `NavigationLink` , `navigationDestination` or `sheet` .

v1 case	Blocked because
6.4 App usage per-app detail	<code>AppUsageReportView</code> (29 lines) has no entry point
6.6 Badges & Accountability	<code>BadgesView</code> (57) and <code>LeaderboardView</code> (72) have no entry point
8.1 Badge awarded on first session	No badge UI to observe it in (award logic itself is unit-tested)
8.2 Daily challenge	<code>ChallengeDetailView</code> (189) has no entry point
8.4 Daily goal detail	<code>GoalsView</code> (133) has no entry point — goals are only editable in Settings and shown inline on Insights

~660 lines across 5 view files remain unreachable (History and its detail view were wired up on 2026-07-27 — see Section I). This is a second wave of orphaned UI, distinct from the services deleted earlier. **Decision 2026-07-27 (owner): deferred — leave as-is for this release.** These views stay in the codebase without entry points, and the cases above stay withdrawn. They are unreachable rather than broken, so there is no user-visible impact and nothing here blocks submission; the only cost is a small amount of dead code in the binary. Revisit post-launch.

Run 1 — 2026-07-27 (developer, physical iPhone)

Sections A, B, C, F, G: passed, with two defects found in B. Section E partially run (D-E2, D-E3 equivalents passed). **Section D was not run** — see "still outstanding" below.

Defects found — both fixed the same day, both need re-test

ID	Symptom	Root cause	Fix
D-B5	Shield-message keyboard could not be dismissed	<code>TextField(axis: .vertical)</code> makes Return insert a newline instead of submitting, and the field had no toolbar or focus binding — so the keyboard had no exit	Added <code>@FocusState</code> + a keyboard Done button (<code>SettingsView.swift</code>)
D-B6	After the 5-second countdown the End focus button was invisible — white text on white	<code>.buttonStyle(.borderedProminent)</code> fills with the inherited tint, and the Quiet theme sets <code>.tint(ZTheme.Palette.textPrimary) = E7E8EC</code> in dark mode. White fill + white label	Replaced with an explicit red fill and white label, independent of tint; muted while counting down (<code>StopBlockingConfirmation.swift</code>)

Regression after both fixes: Release build succeeds, 21 unit + 14 UI tests pass, 0 failures.

Re-test 2026-07-27 (developer, physical iPhone): both confirmed fixed. The shield-message keyboard now dismisses via **Done**, and the strict-mode **End focus** button is legible once the 5-second countdown

completes. **D-B5 and D-B6 → PASS.**

Still outstanding

- **Section D in full (8 cases)** — Live Activity, Dynamic Island and Widget. This contains **D-D3/D-D4/D-D5**, the regression tests for the stuck-timer fix (report Finding 6), which is still unconfirmed on device.
- **D-B5 and D-B6 re-test** on the new build.
- **D-B8** (non-strict end, no confirmation) and **D-B9** (shield survives force-quit).
- **D-E1** (auto-start in window), **D-E4** (toggle off disables), **D-E5** (start notification), **D-E6** (no hijack mid-session).

Section H cannot pass or fail — it lists cases with no UI entry point, so there is nothing to execute. It is a decision to make, not a test to run.

Sign-off

Section	Cases	Passed	Failed	Blocked
A — Screen Time authorization	5			
B — Blocking	9			
C — Sessions & timer	8			
D — Live Activity & Widget	8			
E — Schedules	6			
F — System integration	5			
G — Accessibility	6			
I — Insights (newly wired)	6			
Total	53			

Do not submit to App Review until Section B passes in full. It is the product's core promise and has never been executed.
